FIG. 14

JOSTA® TripleParker

JOSTA® is proud to present the new Triple Parker system. This new and innovative product has been specifically designed to provide a space-efficient, secure and economic parking system on three levels.

It uses an innovative and patented gas cylinder mechanism for easy access bike parking. The bike is lifted and positioned on a third level above two levels of classic Josta 2-tier racks.

This third level parking can be integrated with existing 2-tier racks installation, or it can be used on its own without the two lower levels. In addition, the design is independent of the ceiling, room heights or a sloping ground.

It does not require electricity, and has no direct running or maintenance costs.

The Triple Parker is easy and safe to use, and the combined high/low parking positions ensure that the available space is used to a maximum.
